Household finance sample: emergency savings, SNAP and poverty, by state and group

model-generated prediction, not a measurement

Model forecasts, by state and national group, of 3 questions from the Survey of Household Economics and Decisionmaking (SHED) and the Current Population Survey Annual Social and Economic Supplement (CPS ASEC), for SHED 2026 and CPS ASEC 2027, among all US adults 18 and over. Prepared by Nate Grotberg; forecasts made 2026-11-09 (UTC), report prepared 2026-11-09.

Aggregate estimates for research, planning and public use with their label and citation line; never described as a poll or a survey result. Not a measurement of today, and not an estimate of any policy's effect: the model sees only each source's own history.

- Forecast of: SHED 2026 and CPS ASEC 2027, all US adults 18 and over
- Built from: public SHED data from 2020, 2021, 2022, 2023, 2024 and 2025 (history through SHED 2025); public CPS ASEC data from 2019, 2020, 2021, 2022, 2023, 2024, 2025 and 2026 (history through CPS ASEC 2026); and a population frame from the Census Bureau's American Community Survey 2023. No calibration map is applied to any figure here: every forecast and interval is the model's own output
- Method: a statistical model: multilevel regression with poststratification blended with gradient boosting, anchored to carry-forward more strongly the more cases a cell has (`ensemble_mean@0.4.0`)
- Sealed: 365 recorded rows, SHA-256 `61d95cb5e4979345…` (SHED); 730 recorded rows, SHA-256 `3e1ec27a9dbd51d4…` (CPS ASEC) (The sealed record, below)

Summary

Forecast for SHED 2026 and CPS ASEC 2027, all US adults: share giving each answer. Model-generated prediction, not a measurement.

Question	Answer	Forecast, all adults	80% interval (%)	95% interval (%)	Last measured	Lowest state forecast	Highest state forecast
Emergency savings: would cover a $400 expense with cash or its equivalent	yes	63%	59–67	57–68	63% (SHED 2025)	Oklahoma and Mississippi 51%	Minnesota 73%
Programs: lives in a household that received SNAP	yes	9%	8–10	8–10	9% (CPS ASEC 2026)	Wyoming 4%	New Mexico 17%
Income: below the official poverty line	yes	9%	9–10	8–10	9% (CPS ASEC 2026)	New Hampshire 5%	Mississippi 16%

Source: Nate Grotberg, model-generated prediction of SHED 2026 and CPS ASEC 2027 among all US adults 18 and over, from public SHED 2020–2025 and CPS ASEC 2019–2026 data, made 2026-11-09; 80% interval shown. Not a poll or survey estimate, and not a measurement.

The backtest record behind these forecasts

Before a source was served, its model was run on past waves it had not seen: every item predicted from earlier waves only, then scored against what the wave measured, for all adults and every standard cut. The baseline is carry-forward (repeat the last wave, smoothed toward 50% in thin cuts), the cheap alternative any analyst has. Two numbers per run: the Brier skill of the served model against carry-forward (0 is level, positive is better, +0.10 removes a tenth of carry-forward's error), and how often its 80% intervals held the measured share, with carry-forward's in parentheses. Every figure below is restated from docs/predictors.md.

SHED: the served model on held-out waves, each predicted from earlier waves only and scored cell by cell. A backtest, not a forecast.

Held-out wave	Brier skill against carry-forward	Lowest average top-box miss	80% intervals that held: model (carry-forward)	Defaults chosen on this wave
SHED 2025	+0.055	carry-forward	88% (52%)	yes
SHED 2024	−0.010	the served model	93% (55%)	yes

Source: docs/predictors.md, "Serving five more sources (2026-10-29)". Skill: 1 − model Brier / carry-forward Brier; 0 is level, positive is better.

SHED on points. Level with repeating the last wave on points (a source that barely moves year to year is hard to beat); the case for the model is its intervals.

Selection exposure. The served model's settings were chosen by reading the SHED 2024 and 2025 runs, so those are selection-exposed: their skill is an optimistic estimate of what a forward forecast should expect, not out-of-time evidence (the registry is `prior_predictors.selection_exposure`). No SHED run in this record came after that choice. The SHED 2024 wave is also availability-exposed: the population frame its run used was published after that wave's fieldwork began.

CPS ASEC: the served model on held-out waves, each predicted from earlier waves only and scored cell by cell. A backtest, not a forecast.

Held-out wave	Brier skill against carry-forward	Lowest average top-box miss	80% intervals that held: model (carry-forward)	Defaults chosen on this wave
CPS ASEC 2024	+0.114	the served model	86% (44%)	yes
CPS ASEC 2025	+0.068	the served model	86% (46%)	yes
CPS ASEC 2023	+0.030	the served model	90% (40%)	no

Source: docs/predictors.md, "Serving CPS ASEC (2026-10-28)". Skill: 1 − model Brier / carry-forward Brier; 0 is level, positive is better.

CPS ASEC on points. On points the served model is level with repeating the last wave: on the 32 items asked of all adults its Brier skill against carry-forward was -0.003 and -0.008 (2024 and 2025), and it is ahead on the three items asked of a subgroup (+0.206 and +0.116). Its intervals cover about twice as often as carry-forward's.

Selection exposure. The served model's settings were chosen by reading the CPS ASEC 2024 and 2025 runs, so those are selection-exposed: their skill is an optimistic estimate of what a forward forecast should expect, not out-of-time evidence (the registry is `prior_predictors.selection_exposure`). The CPS ASEC 2023 run came after that choice and is not exposed.

Your custom report

This sample covers 3 catalog items. A custom report runs the same pipeline on the catalog items closest to your own study, forecast before the source publishes and sealed when made.

- **Scope.** Up to three catalog items on your issue, each for all adults, every state the source carries (all 50 and DC; the four Census regions where the public file has no state) and the national groups by age, sex, race and ethnicity, education and region, with 80% and 95% intervals beside the last measured share.
- **Deliverables.** A PDF report like this one and CSVs with every item, cut and answer, both intervals, the measured history and the basis of every figure.
- **Price and turnaround.** $5,000 per issue at the pilot price, 50% on signature; 10 business days from the cleared deposit; one revision of the delivered report included.
- **Not offered.** Groups within a state (such as women in Ohio): the engine makes one-variable cuts. Individual-level scores or lists of people, for any buyer.

What you may do with these numbers

Aggregate estimates by state and national group, for reports, strategy and message testing, and for public use (testimony, press releases, op-eds, member emails) with the label “model-generated prediction, not a measurement” and the citation line below on every use. Never individual-level scores, lists of people or voter-file matching; never described as a poll; never used in paid political ads or candidate campaign material.

How to cite

Source: Nate Grotberg, model-generated prediction of SHED 2026 and CPS ASEC 2027 among all US adults 18 and over, from public SHED 2020–2025 and CPS ASEC 2019–2026 data, made 2026-11-09; 80% interval shown. Not a poll or survey estimate, and not a measurement.

How to read the tables

- **Forecast**: the model's forecast, made 2026-11-09, of the share of US adults in that state or group who give the answer named, as the source will measure it in its next wave (SHED 2026 and CPS ASEC 2027). It is not a measurement of today.
- **80% and 95% intervals**: nominal model ranges targeting coverage four times out of five, and 19 times out of 20. The cited federal coverage checks are on national and demographic cuts; coverage across states has not been established for this offer.

- **Measured**: the weighted share the source recorded in its last wave (SHED 2025 and CPS ASEC 2026), with its number of cases and, in parentheses, its effective cases (the sample size its weights are worth). It is the starting point for carry-forward, the baseline beside each forecast in the CSVs (`carry_forward_pct`).
- **Sample**: *thin* means fewer than 100 effective cases in the state in the source's last wave, *small* 100 to 199. Read a thin state's forecast as a range, not a point.
- Percentages are whole numbers rounded half up once from unrounded values; states.csv and groups.csv carry two decimals, rounded the same way, and the whole-percent bounds the tables use (`*_printed`). states.csv also reads each interval against 50% on those printed bounds.

Emergency savings: would cover a $400 expense with cash or its equivalent. Model forecast for SHED 2026, share answering “yes”

Your question, as written: “Suppose that you have an emergency expense that costs $400. Based on your current financial situation, how would you pay for this expense? (The Fed's derived variable pay_casheqv, "would handle $400 expense with cash or equivalent": covered exclusively with cash, money in a checking/savings account, or a credit card paid in full at the next statement.)”

Catalog item: `emergency_400_cash_or_equivalent`, “Suppose that you have an emergency expense that costs $400. Based on your current financial situation, how would you pay for this expense? (The Fed's derived variable pay_casheqv, "would handle $400 expense with cash or equivalent": covered exclusively with cash, money in a checking/savings account, or a credit card paid in full at the next statement.)” (SHED 2025 item `pay_casheqv`; asked in SHED 2020, 2021, 2022, 2023, 2024 and 2025). Wording match with your question: **exact**.

Answer reported: `yes`, of `yes`, `no`. Shares exclude skipped answers.

Basis of every figure in this section: measured history. Extends what earlier waves of this same question measured in this same group.

Forecast for SHED 2026, all adults (model-generated prediction, not a measurement): **63%** answering yes (80% interval 59–67; 95% interval 57–68). SHED 2025 measured 63% on 12,934 cases.

State forecasts

Emergency savings: would cover a $400 expense with cash or its equivalent. Model forecast for SHED 2026, all 50 states and DC, share answering yes. Model-generated prediction, not a measurement.

State	Forecast	80% interval (%)	95% interval (%)	SHED 2025 measured	SHED 2025 cases (effective)	Sample

Forecasts: model forecast for SHED 2026. Measured: SHED 2025, weighted. Model-generated prediction, not a measurement. Source: Nate Grotberg, model-generated prediction of SHED 2026 and CPS ASEC 2027 among all US adults 18 and over, from public SHED 2020–2025 and CPS ASEC 2019–2026 data, made 2026-11-09; 80% interval shown. Not a poll or survey estimate, and not a measurement.

Thin states. 19 of the 51 shown have fewer than 100 effective SHED 2025 cases: Vermont (16 cases, 15 effective), Alaska (24 cases, 20 effective), North Dakota (29 cases, 27 effective), the District of Columbia (30 cases, 28 effective), South Dakota (32 cases, 30 effective), Montana (35 cases, 32 effective), Wyoming (36 cases, 32 effective), Rhode Island (36 cases, 34 effective), New Hampshire (48 cases, 44 effective), Delaware (52 cases, 49 effective), Hawaii (62 cases, 49 effective), Maine (57 cases, 52 effective), West Virginia (68 cases, 63 effective), Idaho (77 cases, 67 effective), Nebraska (79 cases, 74 effective), New Mexico (90 cases, 75 effective), Mississippi (89 cases, 80 effective), Kansas (101 cases, 89 effective), Arkansas (112 cases, 98 effective). Few real cases means the model leans on how people with the same age, sex, race and ethnicity, and education answer elsewhere, which pulls a distinctive state toward the middle and widens its interval.

National groups

Emergency savings: would cover a $400 expense with cash or its equivalent. Model forecast for SHED 2026, all adults and national groups, share answering yes. Model-generated prediction, not a measurement; all US adults 18 and over.

Group	Forecast	80% interval (%)	95% interval (%)	SHED 2025 measured	SHED 2025 cases (effective)
All adults	63%	59–67	57–68	63%	12,934 (11,307)
Age					
18–29	46%	41–50	39–53	45%	2,091 (1,832)
30–39	56%	51–60	49–62	55%	1,791 (1,609)
40–49	59%	55–63	53–65	59%	2,090 (1,892)

Group	Forecast	80% interval (%)	95% interval (%)	SHED 2025 measured	SHED 2025 cases (effective)
50–59	67%	63–71	61–73	69%	2,084 (1,868)
60–69	74%	70–77	68–79	74%	2,417 (2,177)
70 and over	81%	77–83	76–85	81%	2,461 (2,225)
Sex					
Men	65%	61–68	59–70	65%	6,458 (5,521)
Women	61%	58–65	56–67	62%	6,476 (5,786)
Race and ethnicity

Black, non-Hispanic	40%	36–44	34–47	40%	1,509 (1,391)
Hispanic	46%	41–50	39–53	46%	1,758 (1,570)
Other or multiracial, non-Hispanic	64%	60–68	58–71	66%	1,017 (832)
Education					
No high school diploma	28%	24–33	22–35	26%	677 (588)
High school graduate	51%	46–55	44–58	51%	3,032 (2,614)
Some college	59%	55–63	52–65	59%	3,713 (3,279)
Four-year degree	79%	76–82	74–83	78%	3,403 (3,085)
Postgraduate degree	85%	83–88	81–89	86%	2,109 (1,930)
Region					
Northeast	67%	64–71	61–73	68%	2,227 (1,980)
Midwest	65%	61–69	59–71	65%	2,941 (2,623)
South	59%	55–62	53–64	59%	4,869 (4,306)
West	64%	60–68	58–69	64%	2,897 (2,460)

Forecasts: model forecast for SHED 2026. Measured: SHED 2025, weighted. Model-generated prediction, not a measurement. Source: Nate Grotberg, model-generated prediction of SHED 2026 and CPS ASEC 2027 among all US adults 18 and over, from public SHED 2020–2025 and CPS ASEC 2019–2026 data, made 2026-11-09; 80% interval shown. Not a poll or survey estimate, and not a measurement.

Programs: lives in a household that received SNAP. Model forecast for CPS ASEC 2027, share answering “yes”

Your question, as written: “Lives in a household where someone received SNAP (food stamp) benefits at any time in the calendar year before the interview: "Did anyone in this household get food stamps at any time in 20..?"”

Catalog item: `hh_snap_last_year`, “Lives in a household where someone received SNAP (food stamp) benefits at any time in the calendar year before the interview: "Did anyone in this household get food stamps at any time

in 20..?"" (CPS ASEC 2026 item HF00DSP; asked in CPS ASEC 2019, 2020, 2021, 2022, 2023, 2024, 2025 and 2026). Wording match with your question: **exact**.

Answer reported: yes, of yes, no. Shares exclude skipped answers.

Basis of every figure in this section: measured history. Extends what earlier waves of this same question measured in this same group.

Forecast for CPS ASEC 2027, all adults (model-generated prediction, not a measurement): **9%** answering yes (80% interval 8–10; 95% interval 8–10). CPS ASEC 2026 measured 9% on 102,875 cases.

State forecasts

Programs: lives in a household that received SNAP. Model forecast for CPS ASEC 2027, all 50 states and DC, share answering yes. Model-generated prediction, not a measurement.

State	Forecast	80% interval (%)	95% interval (%)	CPS ASEC 2026 measured	CPS ASEC 2026 cases (effective)	Sample
New Mexico	17%	15–18	14–19	17%	2,578 (1,990)

Forecasts: model forecast for CPS ASEC 2027. Measured: CPS ASEC 2026, weighted. Model-generated prediction, not a measurement. Source: Nate Grotberg, model-generated prediction of SHED 2026 and CPS ASEC 2027 among all US adults 18 and over, from public SHED 2020–2025 and CPS ASEC 2019–2026 data, made 2026-11-09; 80% interval shown. Not a poll or survey estimate, and not a measurement.

Income: below the official poverty line. Model forecast for CPS ASEC 2027, share answering “yes”

Your question, as written: “Below the official poverty threshold in the calendar year before the interview (Census's PERLIS: family money income, or own income for an unrelated individual, against the threshold for the family's size and composition).”

Catalog item: `in_poverty`, “Below the official poverty threshold in the calendar year before the interview (Census's PERLIS: family money income, or own income for an unrelated individual, against the threshold for the family's size and composition).” (CPS ASEC 2026 item `PERLIS`; asked in CPS ASEC 2019, 2020, 2021, 2022, 2023, 2024, 2025 and 2026). Wording match with your question: **exact**.

Answer reported: `yes`, of `yes`, `no`. Shares exclude skipped answers.

Basis of every figure in this section: measured history. Extends what earlier waves of this same question measured in this same group.

Forecast for CPS ASEC 2027, all adults (model-generated prediction, not a measurement): **9%** answering yes (80% interval 9–10; 95% interval 8–10). CPS ASEC 2026 measured 9% on 102,875 cases.

State forecasts

Income: below the official poverty line. Model forecast for CPS ASEC 2027, all 50 states and DC, share answering yes. Model-generated prediction, not a measurement.

Forecasts: model forecast for CPS ASEC 2027. Measured: CPS ASEC 2026, weighted. Model-generated prediction, not a measurement. Source: Nate Grotberg, model-generated prediction of SHED 2026 and CPS ASEC 2027 among all US adults 18 and over, from public SHED 2020–2025 and CPS ASEC 2019–2026 data, made 2026-11-09; 80% interval shown. Not a poll or survey estimate, and not a measurement.

Limits

- All US adults 18 and over, and one-variable cuts only: no groups within a state (such as women in Ohio).
- A forecast of what each source will measure in its next wave (SHED 2026 and CPS ASEC 2027): not a measurement of today, and not a survey.
- The model has no state-level predictor (such as a state's policies or its economy). Each state gets one partially pooled effect on top of age, sex, race and ethnicity, and education, so in a thin state a distinctive result is pulled toward what its demographics predict nationally.
- One time trend serves every state and group: the model cannot forecast a shift in one place that the others do not share.
- Events and policy changes since each source's last wave reach the forecast only through that trend; the model makes no adjustment for any of them.

The sealed record

Every row behind this report from SHED, 365 in all from `carry_forward@0.1.0`, `demographics_only@0.1.0`, `ensemble_mean@0.4.0`, `gbm_pooled@0.1.0`, `mrp_numpyro@0.5.0`, was recorded under a private tenant on a scratch copy of the ledger and sealed at 2026-11-09 23:05 UTC (`seal-shed.json`, SHA-256 `61d95cb5e4979345e1b9b3e3f2bfa786140e658f6a9a0770f99e1cee556c8d00`). The raw distribution of each sealed row, the predictor's own output and what this report prints, is sealed in a supplement (`raw-seal-shed.json`, SHA-256 `f6de4e772ff57bdb9cb8a133f08ad9960fd0e8bddda0a5cdfc6e1483233478d7`). The seal names code commit `5d991f7edcb3`. An OpenTimestamps proof sits beside each stamped file; it dates the file by a Bitcoin block once a calendar's attestation is upgraded. Readers cannot check either until the seal files and rows are released.

Every row behind this report from CPS ASEC, 730 in all from `carry_forward@0.1.0`, `demographics_only@0.1.0`, `ensemble_mean@0.4.0`, `gbm_pooled@0.1.0`, `mrp_numpyro@0.5.0`, was recorded under a private tenant on a scratch copy of the ledger and sealed at 2026-11-09 23:05 UTC (`seal-cps_asec.json`, SHA-256 `3e1ec27a9dbd51d45922a4bc19a0931f0f76de49f679490879fc555b6cc7d7c2`). The raw distribution of each sealed row, the predictor's own output and what this report prints, is sealed in a
